

A-OSP

Augmented Ontological Semantic Platform Computational Semantics for Proof Sovereignty

A local Proof Operating Environment that computes when AI-assisted work may answer, abstain, escalate or expose epistemic debt.

AI creates output.

A-OSP computes proof status.

It does not open the black box.

It moves the trust boundary outside the model.

Proof sovereignty · computational semantics · repo-governed engineering witness

How to navigate this deck.

Four acts build the case; the data room holds the evidence. Each section declares what it is — theory, witness, or category.

Act I**Why it exists**

thesis · problem · category · benchmark · why-now · founder & method

Act II**Why this architecture**

theory · computational semantics · epistemic debt · proof chain

Act III**What is built**

dev method · engineering witness · .aosp.txt · D1/EQL (epistemic query language) · testing · CI/CD

Act IV**Sovereign & investible**

sovereignty · market · model · moat · roadmap & ask · scale → category · gates

Data room

A1–A15 · financials · benchmarks · governance · risks · value capture · founder · repo · theory · semantics · sovereign stack · tests · debt · capital · ledger of meaning

Each section declares: AS-IS vs TARGET, theory vs witness vs category.

ACT I — WHY IT EXISTS

Why A-OSP exists.

Problem, category, competitive boundary, why-now, founder & method.

AI creates output. A-OSP computes proof status.

When models become replaceable, proof identity becomes the asset. A-OSP converts AI-assisted work into reusable proof capital.

Each engagement leaves reusable proof objects, not dead documents — one evidence object, many institutional lenses (compliance, audit, legal, ESG, scientific provenance).

AI output is abundant. Proof is scarce. A-OSP captures the scarce layer.

AI-assisted work cannot be reconstructed.

The bottleneck is no longer generation. It is provenance, scope, gaps, review and accountability.

WHAT CHANGED

AI makes output abundant — documents, policies and summaries arrive faster than verification.

WHAT STAYED HARD

Who said it? Based on what? What is missing?
Who reviewed it? Can it be defended?

WHAT A-OSP TARGETS

The reconstruction layer: source → claim → gap → receipt → artifact → witness → governance.

The failure is not only hallucination. It is unreconstructable institutional work.

A-OSP is a local Proof Operating Environment.

Not a chatbot, not a generic GRC dashboard, not a RAG wrapper. It is the proof layer around AI-assisted regulated work.

A-OSP is

- local proof substrate
- text-first virtual epistemic filesystem
- bounded model-call orchestration
- proof-and-governance workstation
- semantic status engine

A-OSP is not

- chatbot
- generic document repository
- model memory
- autonomous compliance engine
- legal certification

RAG retrieves. GRC tracks controls. A-OSP computes proof status.

Compliance is the wedge. Computational proof infrastructure is the category.

Proof status, not trust automation.

GRC tools automate control posture; provenance standards certify media history. A-OSP computes whether AI-assisted institutional work is admissible under declared proof conditions.

SEGMENT	WHAT THEY PROVE	STRUCTURAL GAP
GRC / trust automation	controls, evidence, audit readiness	vendor-captive control posture
AI governance	model / system risk, policies	governs AI systems, not the work-product proof chain
C2PA-like provenance	source / history of media content	provenance ≠ institutional admissibility
Cloud / LLM providers	logs, traces, model-side receipts	provider capture — not a neutral proof authority

A-OSP computes proof status of work products — local SOT (source of truth) + provider-independence + computable abstention/debt + portability. The empty intersection the four segments leave open — a candidate neutral proof layer outside vendor-captive control.

The category boundary is proof portability: proof objects must travel across tools, auditors and institutions.

The first sale is not the final product. It is how the proof substrate enters institutions.

CATEGORY PROOF MOMENT

Third parties read, write and validate proof objects without trusting the vendor.

Compliance is the wedge; reusable proof objects are the compounding asset.

The wedge buys entry. The substrate creates memory. Portability tests whether A-OSP becomes infrastructure.

The spend already exists. AI just made it acute.

A-OSP does not create a new budget line. It redirects money institutions already spend on reconstruction.

WHO PAYS TODAY

Compliance, audit, cyber and governance already pay consultants, auditors and data rooms to reconstruct evidence.

WHY NOW

AI made institutional output abundant overnight; reconstruction and defensibility became acute and recurring.

WHAT A-OSP CHANGES

It turns that recurring reconstruction spend into reusable proof capital instead of dead documents.

Already-budgeted spend · multi-regime duplication · audit-evidence pain · board / OdV / customer pressure

Compliance, audit, cyber and governance already pay for reconstruction — A-OSP makes it reusable.

Built by someone who lives the proof problem.

The founder profile sits where AI fails inside institutions: evidence, audit, accountability, controls and governance.

FOUNDER ASSET	WHY IT MATTERS
IT Audit & Internal Audit	Audit trail, controls, evidence, responsibility and remediation are native problems.
231 / OdV governance	Organizational liability, supervision, minutes, gaps and accountability known from practice.
Cybersecurity / NIS2 / identity	Connects proof to resilience, provider exposure, perimeter and recovery.
Privacy / AI governance	Moves AI governance from principles to operational evidence.
Applied philosophy of AI	Turns ignorance, uncertainty and responsibility into system objects.

Investment interpretation

Founder profile explains category coherence; the round exists to make the institution independent from the founder.

A-OSP is not AI looking for governance. It is governance, audit and proof discipline rebuilt around AI.

The discipline was built before it was sold.

A-OSP began as the founder's own theoretical reflection on the limits of representation and local computability, developed and published openly — then forced into an engineering practice.

TWO FAILED BUILDS → A GOVERNED LAB

After two failed attempts to build a coherent webapp, the founder stopped asking LLMs for code and started orchestrating them as a disciplined lab: blueprints, audits, trade-offs, welds.

“CUT TO THE CHASE” → COMPRESSION

One decision collapsed the mess: pick the ideal enterprise stack, then build an OS-like layer around a virtual epistemic filesystem. Technical leadership without being an engineer.

ANTI-FALSE-GREEN, SELF-APPLIED

The rule A-OSP sells — file / UI / completion ≠ proof — was first forced onto its own development. The method is the product, applied to itself.

Multiplier 1 — Founder leverage already demonstrated

~€10k of founder capital-at-risk plus governed AI orchestration produced the witness, the corpus and the method. Interpretation: this proves compression, category coherence and disciplined AI orchestration — not market validation, production readiness or security certification. The round funds the next multiplier: converting founder-operated proof discipline into a team-operable institution.

Founder-market fit demonstrated, not claimed: he built the control system for the chaos he lived.

ACT II — WHY THIS ARCHITECTURE EXISTS

Why this architecture exists.

Theory lineage, local computability, computational semantics and epistemic debt.

The theory explains the architecture. The product is the witness.

Theory provides design grammar; the webapp is the engineering witness.

Claim discipline

A-OSP is ECNN-inspired and local-first. It is not claimed as a formally complete ECNN. The webapp is the witness: VFS, typed stripes, EQL/MONL, receipts, witness and governance.

Theory is the design grammar that explains why the product is built this way.

Why A-OSP does not promise universal truth.

It computes local proof status under declared constraints — and states precisely what it does not claim.

RICE

Non-trivial semantic properties are undecidable in general.

GÖDEL

No formal system closes all truth internally.

A-OSP RESPONSE

Compute admissible proof status under declared horizons — not total truth.

ALLOWED	FORBIDDEN
local proof status under horizon	universal truth machine
admissible transmission between scopes	global semantic completeness
computed unknown / contradiction / debt	guaranteed correctness

Local proof status under declared constraints — not universal truth.

Not the truth of a claim — its admissibility under a horizon.

A-OSP does not compute whether a claim is true (Rice/Gödel forbid that in general). It computes a decidable, restricted question: in what epistemic state is the claim, relative to a declared horizon.

THE HORIZON

$H = \langle S, \Sigma, T, R, M, V \rangle$

- S** sources — typed admitted evidence
- Σ** scope — declared perimeter
- T** transmissions — admissible transforms
- R** receipts — receipt + readback + hash
- M** matrix — support / contradiction state
- V** validation — false-green predicate

$\llbracket c \rrbracket$ computes one of

- supported — backed in S within Σ , receipted in R , no conflict in M , V holds
- unsupported — no support within Σ
- contradiction — M holds divergent evidence
- out-of-scope — support falls outside Σ
- review-required — V not yet satisfied
- blocking-debt — a transform in T lacks receipt in R

Changing the horizon can change the state — that tracked relativity is what makes it computable.

When semantic distinctions are lost, debt appears.

Epistemic debt is the residual obligation left when meaning is transformed, collapsed, labelled, transferred or reified without enough provenance, scope or validation to support downstream use.

OPERATION / FAILURE	DEBT
source missing	trace debt
label too broad	label debt
domain transfer	scale debt
claim promoted too early	reification debt
validation absent	validation debt

Undecidability is the formal limit. Epistemic debt is the governance residue.

“I don’t know” is not a phrase. It is a computed state.

The difference between a chatbot and a proof environment is where the unknown lives.

CHATBOT	A-OSP EPISTEMIC HEAD
“I don’t know” as style	unknown as computed state
confidence score	admissibility under proof graph
provider answer	local proof-state evaluation
refusal	abstention with scope and debt
model memory	typed local graph

answer
when supported

abstain
when not supported

escalate
when governance is needed

expose debt
when meaning is unresolved

From output to proof object.

An output becomes institutionally usable only by crossing a proof chain — a sequence of permissions, not a formatting pipeline.

FORBIDDEN EQUIVALENCE	CORRECT INTERPRETATION
output = proof	output is only a candidate surface
log = receipt	receipt requires shape, scope, hash / readback
export = witness	export needs witness-backed proof state
UI green = proof	green is earned only by proof predicates
model memory = SOT	SOT is local typed stripes

A proof chain is a sequence of permissions, not a formatting pipeline.

ACT III — WHAT HAS BEEN BUILT

What has been built.

A founder-built, AI-orchestrated engineering witness with repo governance and proof seams.

The build was AI-orchestrated chaos — then governed.

The same discipline A-OSP sells — file / UI / completion $\neq$ proof — was first forced onto its own development. The method is the product, applied to itself.

THE ENTROPY (shown, not hidden)

- hallucinated code
- duplicated implementations
- issues closed-but-not-welded
- noisy / overlapping workflows
- fake-green checks
- UI ahead of the proof substrate

“this is what AI-assisted development actually produces.”

THE MULTILAYER CONTROL CHAIN

E2E critical journeys = HARDENING: a journey is PASS only when scheduled, executed and observing the required artifacts — not because a file or a screen exists.

Founder-market fit, demonstrated: he built the control system for the chaos he lived.

The repo governs AI-assisted development.

Self-applied: the repository contains protocols that orient AI agents across local work, global vision, risk and proof boundaries.

AGENTS.MD

binding entry point for AI agents

IKANT PROTOCOL

anti-injection · required reads · authority
precedence

BUSSOLA

past · present · future · vision

TRADE-OFF

local vs global · effort · debt · alternatives

ICP GATES

issue alignment · roadmap · dataflow ·
breaking changes

AUTHORITY HIERARCHY

code > tests/CI > config > docs > issues > AI
plans

This does not prove enterprise readiness. It proves a method of layered governance for 1FTE + AI development.

aosp1 is the engineering witness.

The repository demonstrates the intended stack, proof boundaries and hardening path. Status: AS-IS / HARDENING, not production-certified.

BROWSER-BASED EPISTEMIC OS

web OS-like app surfaces

VIRTUAL EPISTEMIC FILESYSTEM

.aosp.txt typed append-only stripes

PARSER-SERVICE

EQL / MONL read/write/query boundary

DIRECTUS / POSTGRESQL

cache / index, not truth

D1/EQL PROOF SEAM

receipt, readback, explicit scope

GOVERNANCE DOCS

authority hierarchy and proof scripts

CI/CD CONTROL PLANE

classified, budgeted, hardening

EU-FIRST STACK

target posture (see A10)

Interpretation

aosp1 is not a finished enterprise product. It is a concrete witness that the stack, abstractions, proof seams and repo-governance method can exist together.

A witness, not a certificate.

Enterprise webapp + epistemic OS-like abstractions.

A-OSP uses dominant web technologies, then adds proof-native OS-like abstractions over the stack.

Web stack = enterprise substrate. A-OSP = epistemic / proof abstraction layer.

Plain text is not a downgrade. It is the resilience layer.

A-OSP does not use TXT instead of enterprise infrastructure. It uses TXT as the canonical proof substrate.

TECHNICAL BIAS	A-OSP RESPONSE
“TXT does not scale”	Text is SOT / event-log; parser, cache and DB handle query and performance.
“You need a database”	The database exists — it is cache / index / RBAC, not institutional truth.
“TXT is fragile”	Plain text is portable, diffable, inspectable, versionable and legacy-resilient.
“Where is schema?”	Stripes are typed; schema lives in parser / contracts / registry.
“Enterprise?”	Enterprise means recovery, auditability, access control, observability, reproducibility.

DB-resilient, not DB-less. LLM-resilient, not LLM-free. If the database, model or vendor changes, institutional proof remains readable.

First proof seam: receipt, readback, explicit scope.

D1/EQL is not claimed as full enterprise proof. It is the first proof seam to prevent false-green.

D1 PROOF

D1Receipt PASS + readback_hash + explicit session scope

EQL PROOF

EQLQueryReceipt + queryHash + resultHash + explicit scope

False-green rule

A completion modal, raw query success, a filled questionnaire or a local fallback atom do not equal proof.

Minimum proof substrate before D2–D5, not full proof spine.

The system must not look green before it is proof-green.

The goal is not to hide incomplete proof. The goal is to prevent incomplete proof from looking complete.

STRUCTURAL D1 TEST

no D1 green without PASS receipt

REQUIRED CHECKS

D1, dataflow, ontology, a11y, proof

E2E DETERMINISM

no static skip / hard wait in critical journeys

SEED BASELINE

canonical .aosp.txt inputs hashed

CAVEAT

full UI proof run remains opt-in / hardening in parts

No green without proof predicates.

Not every check means the same thing.

A-OSP classifies controls before claiming control: blocking, evidence, advisory, nightly, manual and deprecated checks differ in meaning.

CLASS	MEANING
blocking	must pass before merge
evidence	produces artifacts, no verdict
advisory	visible, not blocking
nightly	scheduled monitoring
manual	dispatch-only
deprecated	historical / archive

AS-IS inventory

- 81 workflow files
- 50 active · 31 archived
- 8 blocking budget
- 21 evidence · 11 advisory
- 8 nightly · 2 manual

Investment task: classify, budget and consolidate — this is what the round funds, not more workflow noise.

Honest status

Rich but still hardening. The goal is not more workflow noise; it is classified, budgeted, progressively consolidated control.

A-OSP classifies controls before claiming control.

ACT IV — SOVEREIGN & INVESTIBLE

Why it is sovereign and investible.

Provider resilience, EU-first posture, market wedge, moat stack, gates and ask.

Model ≠ memory. Database ≠ truth. Export ≠ proof.

Provider-agnostic proof sovereignty: proof identity stays local even while models, databases and clouds remain useful.

MODEL

replaceable processor for
bounded transformations

DATABASE

rebuildable cache · index /
RBAC / acceleration

UI / EXPORT

projection and representation,
not proof by itself

.AOSP.TXT SOT

local institutional proof
substrate — human + machine
readable

A-OSP is not anti-provider. It is anti-provider-capture. Providers may process; they must not own proof, memory or institutional truth.

local truth

bounded processing

receipt & readback

witness & governance

Resilient by role separation, not by denial.

A-OSP does not eliminate providers. It limits what providers are allowed to mean.

COMPONENT	USED FOR	NOT ALLOWED TO OWN
LLM	bounded transformation under FAE (focus·attention·execution)	memory, truth, proof state
Database	index, cache, RBAC, acceleration	canonical knowledge
UI	navigation, projection, review	proof by appearance
Export	sharing, reporting	witness without receipt
.aosp.txt	local proof substrate	performance engine alone

AS-IS caveat · economics

Adapters exist today; target: provider registry + EU-first routing + self-hosted. Cost note: value is governability, not doing the work cheaper — but the substrate is cheap to run, since bounded calls on typed stripes don't need frontier models. Cost scales with proof depth, not model price.

Sovereignty is architectural first, EU-first second.

A-OSP is sovereignty-aligned because proof identity is provider-independent. EU-first is a deployment and dependency policy, not the core proof claim.

1 · Proof remains local

Institutional truth lives in .aosp.txt, never owned by a provider.

AS-IS

2 · Providers are replaceable

Models, databases and clouds are bounded, swappable processors.

AS-IS

3 · EU-first routing

EU / self-hosted adapters as the target routing posture.

TARGET

4 · Exposure register controls risk

Every dependency tracked with payload class, sensitivity and validation.

TARGET

Proof remains local. Trust becomes portable — provider-independence is the claim, EU-first the policy.

Companies already pay for reconstruction.

The cost exists today: consultants, audit, compliance, data rooms, remediation, board reports. Value often dies in documents.

TODAY	WITH A-OSP
audit archaeology	reconstructable proof trail
dead reports	reusable proof capital
evidence rebuilt multiple times	one evidence object, many lenses
AI output hard to defend	receipt / gap / review state
fragile green dashboards	computed proof status

A-OSP makes compliance spend accumulate instead of evaporate.

Integrated compliance: one evidence object, many lenses.

Compliance is where evidence, absence of evidence, review and accountability are already paid for.

Why compliance first

- already budgeted
- multi-regime duplication
- audit evidence pain
- board / OdV / customer pressure
- proof and review already matter

Lenses over the same evidence object

231 / OdV

GDPR

NIS2

DORA

ISO 27001

Health & Safety

AI governance

(DORA / ISO map to RegTech & mid-market; 231 / H&S / GDPR are the SME wedge.)

Prior work matters

The compliance wedge is not opportunistic. It follows prior integrated-compliance work on multi-regime cost, evidence reuse and overlapping obligations.

Compliance is the wedge. Computational proof infrastructure is the category.

The first sale is not the final product — it is how the substrate enters institutions.

Each price point is also an infrastructure role: every engagement seeds and extends the proof graph.

REVENUE LINE	PRICE	INFRASTRUCTURE MEANING
Proof Diagnostic	€2.5–4.9k	proof-graph seeding
Proof Pack	€6–15k	scoped proof subgraph
Evidence Vault	€0.6–2.4k/y	recurring institutional memory
Proof Maintenance	€3–18k/y	live proof-graph operation
Channel / advisor program	€15–75k/y	distributed proof production
RegTech adapter / enterprise	€90k+ · ent. €120–320k	ecosystem embedding
Conformance validator	post-M36	standard adoption surface

Revenue lines today; infrastructure roles tomorrow — the substrate enters, then compounds.

Proof is adopted through trust networks.

A-OSP sells proof, not automation. It enters through intermediaries who already speak evidence, governance and risk.

ODV / 231

organizational liability

INTERNAL AUDIT

controls + evidence

PRIVACY / AI GOV

data + accountability

CYBER / NIS2

security + resilience

UNIVERSITY / RESEARCH

governance + public interest

**ADVISORS / ASSOCIATIONS /
REGTECH**

distribution + trust

Trust networks reduce cold-start risk but do not replace paid validation.

Enter through people who already speak evidence, governance and risk.

Revenue is built by mixed market units.

Y3 revenue cannot come from manual assessments alone. It requires mixed market units and recurring proof capital.

MARKET UNIT	ANNUAL TARGET
Association unit	€150–300k
Advisor / OdV unit	€100–300k
Mid-market workflow	€150–350k
RegTech adapter / pilot	€150–500k
Enterprise pilot + maint. (post-M36)	€150–300k

Delivery capacity — the mother metric			
	Y1	Y2	Y3
h / assessment	100	55	35
assessments / FTE	~7	~13	~21
founder-dependency	high	<60%	<40%
Manual delivery must decline through templates, proof objects and co-delivery.			

Revenue logic

recognized revenue = diagnostics + proof packs + maintenance + association + advisor/OdV + mid-market + RegTech pilots / adapters. Category unit (ecosystem / conformance / platform ARR) is post-M36 only.

Unit counts are bounded by delivery capacity, not by ambition.

The moat is layered, not singular.

A stack of theory, semantics, architecture, proof, governance, sovereignty and commercial trust — not a single feature.

THEORETICAL

ROA / RLA / CRC / ECNN design grammar

SEMANTIC

answer / abstain / escalate / debt

ARCHITECTURE

local SOT, VFS, parser, EQL/MONL

PROOF

receipt, readback, scope, witness, false-green prevention

GOVERNANCE

AGENTS, iKant, Bussola, ICP, authority hierarchy

SOVEREIGNTY

provider-replaceable, EU-first target posture

COMMERCIAL

compliance wedge + trust networks + foundation-backed proof commons

As generation commoditizes, value migrates to the proof layer. A-OSP is strategically unnatural for incumbents built around data gravity and proprietary memory; sovereign, scientific and public-interest demand is optionality earned by the substrate — not near-term revenue.

Seven layers, one cause — copyable feature by feature, not as the structure that generates them together.

The moat is not certainty. It is disciplined visibility.

A proof company must prove its own limits first.

LAYER	STATUS
.aosp.txt SSOT / DB cache	implemented design / hardening
D1/EQL seam	first seam active / not full proof spine
iKant / AGENTS protocol	active repo contract
AI-powered governance	partial / advisory / fallback
CI topology	generated / classified / still complex
E2E determinism	critical journeys hardened; long tail staged
EU-first stack	target posture, not AS-IS default
enterprise readiness	gated target (P1/P2)

A proof company must prove its own limits first.

Monetize the runtime. Steward the commons.

Commercial upside funds execution; mission-locked flows protect the standard — all gated, not in this ask.

OpCo captures commercial value

- managed runtime
- enterprise modules
- integrations & SLAs
- customer contracts
- RegTech / GRC / LegalTech adapters

Foundation stewards trust value

- open proof specification
- conformance mark + reference validator
- training & accreditation
- grants & public-interest deployments

Conditional foundation economics: mission-locked economic rights + arm's-length conformance / validator flows + endowment trigger at adoption or liquidity gates + independent governance after portability signals. Proof-commons stewardship is the stewardship layer of Multiplier 3 — gated optionality, not in this ask.

4-year formation plan. M36 activation gate.

The plan keeps the activation event gated, not promised.

Y1

OpCo, CTO, P0 / D1 / EQL closure, first paid diagnostics

Y2

Repeatable delivery, P1 controls, advisor / association channels

Y3

Market units, RegTech / mid-market pilots, founder-dependence ↓

M36

Activation review: enterprise pilots, strategic round, standards trigger

Y4

Scale and standards option

THE ASK (€6.5M = T0) — GATED CAPITAL LADDER

1 · Proof tranche T0

€2.5M

gate: CTO M3 · SRL · D1/EQL closure · P0 · ≥5 paid diagnostics

2 · Institutional formation tranche T0

€4.0M

released against first clients · D2 repeatable proof flow · workstation alpha · D3–D5 roadmap · P1 controls · channel evidence

Not in this ask:

3 · Multiplier 2 strategic (Series-A)

M36 · €10–15M

→ €100M+ category; gated; not in this ask

4 · Multiplier 3 portable proof-standard option *possible · gated on adoption · not in this ask*

Total ask = €6.5M (T0, drawn in tranches). Multiplier 2 and Multiplier 3 are separate, gated, and not part of this round — they show the trajectory, not the request.

€100M+ ARR is the category proof threshold, not the ceiling. The larger upside appears only if third parties adopt portable proof objects.

Three horizons, three economies. The jumps are gated by adoption, not by time; the multiplier originates in founder leverage, not at M36.

T0 · Formation · Y1–Y3

UNDERWRITTEN

€5.8M recognized

repeatable delivery · P0/P1 controls · channels · founder-dependence < 40%

Multiplier 2 · Scale → category · post-M36

GATED

€15–30M ARR → €100M+

enterprise · RegTech adapters · advisor/OdV channels · third-party portability

Multiplier 3 · Portable standard · 4+ yrs

POSSIBLE

valuation logic may begin
to shift beyond product
ARR multiples

proof format read, written and validated across tools, auditors and institutions; proof-infrastructure economics.

The category exists when third parties can read, write and validate A-OSP-compatible proof objects without trusting the vendor.

Formation proves the company. Portability tests the category. Adoption earns the standard — gated by portability, not declaration.

Why €100M+ is a threshold, not a wall.

Illustrative · gated on portability. €100M+ ARR is reached by combining engines — not by multiplying delivery services.

ENGINE	ILLUSTRATIVE SCALE	ARR
Enterprise proof workspaces	300 × €120k	€36M
Advisor / audit / OdV channels	400 × €75k	€30M
RegTech / GRC / LegalTech adapters	120 × €250k	€30M
Conformance / validator / training	—	€5–15M
Total	—	€100M+

BEYOND THE THRESHOLD (Multiplier 3)

- at the threshold the market confirms the category exists
- if the proof format is adopted by third parties, valuation logic may begin to shift toward infrastructure adoption, interoperability and standard penetration
- economics shift from product (ARR multiple) to proof infrastructure / standard
- a possible global multiplier — gated on adoption, not promised

Structural implications of a schema-agnostic substrate, shown to make the ceiling legible. No valuation is claimed; figures are illustrative and gated.

€100M+ confirms the category. Adoption — if it comes — opens the global layer.

Fund discipline, not faith.

Founder leverage is not validation. Enterprise claims require gates. Economic claims require benchmarks. Semantic claims are bounded by horizon.

Activation gates

- P0 proof seam · P1 controls · P2 tenant/cost/failover
- full proof-flow demo repeatable
- provider-exposure registry + EU-first adapter plan
- 20 paid assessments · 2 channels · 1 RegTech pilot
- founder-dependence < 40%
- repo governance reproducible by CTO/team
- hardening-deferred index reduced
- revenue bridge validated
- category signal: ≥3 third-party integrations / conformance pilots

ALLOWED	FORBIDDEN
computational semantics under horizon	universal truth machine
founder-built proof asset	market-validated company
D1/EQL first seam	end-to-end proof-grade platform
enterprise-readiness plan	production-certified product
benchmark hypothesis	proven cost reduction

Additional no-go

No scale if the CI blocking/advisory map is unmaintained, the full proof-flow demo is not repeatable, or the hardening-deferred index grows without owner.

No activation without gates. No green without proof. No truth without horizon.

Fund computational proof sovereignty, not another AI wrapper.

A-OSP is a founder-built, AI-orchestrated engineering witness for local computational semantics: theory-informed, repo-governed, provider-resilient, EU-sovereignty aligned, honest about hardening, and designed to turn AI-assisted work into reconstructable institutional evidence.

Models generate.

A-OSP computes whether the result may be institutionally used.

Institutions decide.

But only after proof status, scope, debt and governance are visible.

Appendix — diligence pack.

Ledger of meaning

Revenue bridge & runway: how Y3 is built and funded.

Illustrative. Revenue must come from market units and recurring proof capital, not manual assessments alone.

Y3 SOURCE	REV	GM%
Association · 6×€225k	€1.35M	78%
Advisor / OdV · 5×€200k	€1.00M	76%
Mid-market · 8×€150k	€1.20M	74%
RegTech · 3×€250k	€0.75M	82%
Assessment / packs / maint.	€1.50M	58%
Blended	€5.80M	72%

Blended 72% GM = recurring lines (74–82%) offset by the lower-margin assessment / packs line (58%).

Runway (€6.5M round)

	Y1	Y2	Y3
Recognized rev.	0.6	1.85	5.8
Gross margin	50%	64%	72%
Opex	2.43	3.20	4.87
Net burn	2.13	2.02	0.69
Cum. cash left	4.37	2.35	1.66

€ M. Net burn = opex – gross profit. €6.5M covers projected net burn through ~M36 if revenue tracks; projected M36 cash buffer is €1.66M.

Interpretation

Y3 (€5.8M) is below full break-even: At €4.87M opex and 72% GM, break-even revenue is ~€6.76M. M36 remains activation review, not profit guarantee. The formation case stops at €5.8M recognized revenue; the ARR scale case is not underwritten here — it is unlocked only after M36 activation.

Benchmark pack: prove the economics — and the category.

Economics are a benchmark program; portability and conformance test whether A-OSP is a standard, not just an app.

LLM COST / PROOF PACK € / pack	PROVIDER SUBSTITUTION DELTA quality–cost	READBACK SUCCESS %	UNSUPPORTED-CLAIM DETECTION %
FALSE-GREEN DETECTION %	PROOF-FLOW COMPLETION RATE %	PROOF PORTABILITY ACROSS TOOLS platform vs app	THIRD-PARTY CONFORMANCE PASS RATE standard readability

Strategic / Series-A (Multiplier 2)

separate, released at the M36 activation gate

€6.5M is not the cost of an MVP. It is the cost of converting a founder-built proof asset into an enterprise-operable company — staged against gates, not spent as a multiplier burn.

** Founder/CEO pay is OpCo-board approved; no undisclosed fees or double compensation. Any standards-vehicle role is separately disclosed and conflict-approved; founder upside remains primarily equity-based.*

AREA	AMOUNT
Engineering core	€2.05M
Product / security / cloud	€0.78M
Legal / IP / governance	€0.62M
Delivery / customer success	€0.57M
GTM / channel	€0.52M
Admin / insurance	€0.39M
Standards / offices / welfare	€0.57M
Contingency	€0.55M
Founder/CEO comp* & exec office	€0.45M
Total	€6.50M

Governance is part of the product.

A proof standard cannot be captive to the same vendor that monetizes the runtime.

OpCo captures value

- product IP
- managed runtime
- enterprise modules
- customer contracts
- SLAs and integrations

Standards vehicle protects trust

- open proof specification
- conformance mark, not legal certification
- reference validator / open core
- training, standards, grants and public trust

The standards vehicle is not governance theater. It is the competitive structure that lets A-OSP monetize the runtime while making proof format, validator and conformance trust credible beyond the vendor.

Risk and stop rules.

The pitch should make risk governable, not invisible.

RISK	STOP / MITIGATION
Category confusion with GRC SaaS	Benchmark slide: proof status vs control posture; portability as the boundary.
Incumbent feature-copy / provider receipts	Local SOT, provider-independence, conformance validator — not receipt-as-feature.
Standards adoption failure	No foundation-heavy model without ≥ 3 third-party adoption signals.
Public-sector procurement trap	Research / public-interest pilots first; no defense/PA scaling before P1/P2 + sovereign-readiness.
Founder consulting trap	Founder-dependence < 40%; delivery kit; co-delivery channels.
Manual assessment economics	No scale if h / assessment does not fall by Y2 close.
LLM provider lock-in / cost overclaim	Provider registry + EU-first adapters; benchmark cost, no guarantee.
Enterprise maturity gap	P1/P2, tenant isolation, failover, auditability before public/defense.
Founder-only knowledge	CTO / team runbooks + onboarding.
Governance theater / CI noise	Promote advisory to blocking only when stable; classify, budget, prune.

Dual-capture economics & related-party governance.

LOA defines the two-entity structure; A15 defines the economic anti-capture mechanism — conditional, non-controlling, gated.

RISK	STOP / MITIGATION
Foundation drains OpCo / non-investable	Conditional economics; non-controlling rights; no early cash drain; arm's-length terms.
Decorative / governance-theater foundation	Conformance mark, validator, mission-locked endowment trigger, public proof-commons mandate.
Related-party conflict (OpCo ↔ foundation)	Conflict register; independent approval; founder abstention; external counsel; annual transparency.
Public / grant capital contamination	Grants fund the commons, not OpCo ARR; separate accounts; clear IP boundaries.
Research scope creep	Mission-aligned research only; annual charter; measurable outputs (specs, validators, benchmarks).
Endowment burden too early	No endowment-heavy burden before adoption gates; triggers at M36 / scale / liquidity only.
Standard captured by the vendor	Open spec + reference validator + independent governance once portability signals appear.
IP leakage commons ↔ OpCo	Documented licence boundaries; no grant-funded private capture without licence.
Investor skepticism on “standard”	No standard claim before third-party read / write / validate; “portable proof-standard option”; category moment gated.
Founder dual-role (OpCo CEO + foundation)	Roles separately disclosed and conflict-approved; founder upside primarily OpCo equity.

Founder CV profile: category coherence.

The founder profile explains why proof, governance, AI and infrastructure sovereignty converge in one category.

CLUSTER	RELEVANCE
Audit / controls	Proof, reconstruction, accountability, audit trail.
231 / OdV	Organizational liability, governance, evidence, review.
Cybersecurity / NIS2 / identity	Resilience, provider exposure, perimeter, recovery.
Privacy / AI governance	Operationalizes AI governance as evidence infrastructure.
Applied philosophy of AI	Turns uncertainty and ignorance into system design.
Math / economics / game theory	Incentive-aware design for vendors, auditors, regulators.

Founder as originator of coherence, not permanent delivery engine.

Repo evidence map.

Map major pitch claims to concrete evidence surfaces in the aosp1 repository and data room.

CLAIM	EVIDENCE
VFS text-first	docs/02-FILESYSTEM.md
DB cache, not truth	docs/CANONICAL_SOURCES.md
dataflow discipline	docs/AI_DATAFLOW_GUIDE.md
agent governance	AGENTS.md
D1/EQL seam	docs/convergence/C1_D1_EQL_PROOF_SEAM.md

E2E determinism	docs/E2E_DETERMINISM.md
LLM providers AS-IS	backend/parser-service/src/llm/types.ts
Docker self-host path	backend/docker-compose*.yaml
Governance / LOA	Legal Operating Architecture full memo

Theory lineage.

The theory is not the product. It is the design grammar that explains the product.

LAYER	ROLE
Rice / Gödel	limits of universal semantic decision
ROA	observer governance, controlled reification, epistemic debt
RLA / CRC	local computable closure under horizon
ECNN / ECU	bounded epistemic units; epistemic head
iKant	normative meta-control: answer, abstain, escalate, expose debt
A-OSP	local-first proof OS: VFS, typed stripes, EQL/MONL, receipts, witness

Claim limit

A-OSP is ECNN-inspired. It is not claimed as a formally complete ECNN or as a research proof of ROA.

Computational semantics — the formal object.

Why the term is defensible: the object of computation is a total function into a finite, discrete set of states — decidable by construction within a declared horizon.

The semantic function

$\llbracket c \rrbracket_h : \text{Claim} \times \text{Horizon} \rightarrow \{ \text{supported, unsupported, contradiction, out-of-scope, review-required, blocking-debt} \}$
 with $H = \langle S, \Sigma, T, R, M, V \rangle$

STATE CONDITIONS

- supported $\Leftrightarrow \exists$ support in S within Σ , reached by T , each with receipt in R , no conflict in M , V satisfied
- contradiction $\Leftrightarrow M$ holds divergent evidence
- out-of-scope / review-required $\Leftrightarrow$ support outside Σ / V unmet

EPISTEMIC DEBT (the passive side)

$\text{debt}(c, H) = \{ t \in T : \text{receipt}(t) \notin R \vee \neg V(t) \}$

A transformation that moved meaning without sufficient receipt or validation. When $\text{debt}(c, H) \neq \emptyset$ and touches c , the state is blocking-debt. This is double-entry applied to meaning.

Horizon relativity

$\llbracket c \rrbracket_h \neq \llbracket c \rrbracket_{h'}$ is expected: narrowing Σ , enriching S , or adding receipts in R can move a claim from review-required to supported. Universal truth is not horizon-relative; admissibility is — by definition. The two-node statement (L_i, L_j, T_{ij}) is the special case of this structure.

Sovereign stack register.

Explicit AS-IS vs target posture per dependency layer — the basis of the EU-first dependency policy.

LAYER	AS-IS	TARGET
LLM	OpenAI / Anthropic	Mistral / EU-hosted / self-hosted adapters
DB	PostgreSQL / Directus	self-hosted; DB as cache
Cache	Redis	self-hosted
Runtime	Docker / Traefik	EU cloud / on-prem / sovereign hosting
DevOps	GitHub / npm	EU mirror + SBOM + signing
OS / devices	web-first	Linux / Android-first where feasible
Productivity	generic	privacy-aligned suite

Testing / anti-regression map.

A-OSP treats tests as proof surfaces, not decoration.

REQUIRED CHECKS

D1 SSOT, golden D1, ontology, dataflow, a11y, proof

E2E DETERMINISM

no static skips / no hard waits in critical journeys

FLAKE BUDGET

per-project tolerance; zero for critical gates

SEED BASELINE

hash canonical .aosp.txt inputs before E2E

FALSE-GREEN STRUCTURAL TEST

no D1 green without PASS receipt

DATAFLOW CONTRACT GUARDS

structural protection of canonical sources

Caveat

Full UI proof runs remain opt-in / hardening in parts. Testing moat = explicit anti-regression semantics, not a claim that all proof flows are finished.

Hardening debt index.

A-OSP does not hide hardening debt. It classifies it: visibility does not equal closure.

FINDING	MEANING
30 merged PRs scanned	deferred / out-of-scope / follow-up items extracted
47 distinct deferred items	grouped into 8 clusters
42 in-repo work items	tracked as bounded hardening work
18 follow-ups	eligible for adoption / wiring waves
9 post-MVP defers	explicitly not current MVP
Status caveat	visibility does not equal closure

Trust interpretation

Maturity honesty is a trust asset: the moat is disciplined visibility and layered risk reduction by a 1FTE non-engineer founder amplified by frontier AI — not certainty.

Capital & category: the right money for the right ceiling.

A-OSP forms as proof infrastructure, not a GRC SaaS — capital and investors must match the category, or it gets mispriced.

INVESTOR FIT

- deep-tech / infrastructure funds
- EU digital-sovereignty capital
- strategic / public-interest-adjacent
- NOT generalist seed SaaS — would price it as a compliance tool
- category readability is the diligence axis, not ARR multiple

BLENDED CAPITAL

- equity → OpCo (product, runtime, IP)
- EU / research grants → standards vehicle (non-dilutive)
- strategic anchor → legitimacy + adoption signal
- the two-entity LOA (OpCo + proof-commons foundation) keeps the streams clean and non-contaminating
- blended formation is the higher-altitude version of the same raise

Regulation creates the obligation. Standards create the language. A-OSP can become the local proof substrate that makes AI-assisted institutional work reconstructable.

Match the capital to the category — or be mispriced as a compliance tool.

From compliance to a ledger of meaning.

Why the ceiling is high without inflating the ask: compliance is the first schema of accounts on a schema-agnostic substrate — not the last.

DOUBLE-ENTRY, APPLIED TO MEANING

- asset — what is conserved and proven: source, scope, receipt, readback, validation
- liability — what is lost or unjustified: gap, unvalidated inference, epistemic debt
- every transformation books both sides; the proof graph is the ledger

ONE SUBSTRATE, MANY REGISTERS

Compliance

AS-IS wedge

Accounting / audit assurance

OPTION

ESG / CSRD reporting

OPTION

Legal chain-of-custody

OPTION

Scientific provenance

OPTION

These are structural implications of a schema-agnostic substrate, not a product roadmap. The accounting parallel is a lens that illuminates the structure — not a claim.

Compliance is the first schema, not the last. The substrate is schema-agnostic by construction.
