

A-OSP

Institutional Formation & Enterprise Readiness Pitch

From founder-built AI proof asset to enterprise-operable OpCo/Foundation infrastructure for European informational sovereignty

Commercial first

paid wedge + delivery evidence

Enterprise-ready

full stack before big-bang

Foundation-bound

open standard + sovereignty

Recommended formation ask: EUR 6.0M · optional EUR 1.5–2.0M extension · 30-month target runway

AI creates output; A-OSP creates proof

The first capital does not buy a finished company. It buys institutional formation and enterprise operability.

AI output

fast but weakly reconstructable

Proof object

source, lineage, receipt, gap

Enterprise stack

security, recovery,
observability

Open standard

Foundation-bound trust layer

EUR 6.0M

target runway

conditional on A1–A2 revenue
discipline

7/10 gates

big-bang rule

proof + enterprise + market +
governance

Commercial beginning. Foundation trajectory. Enterprise-ready before big-bang.

THE PROBLEM

AI work is fast; proof is slow

Boards do not buy “smart AI”. They buy defensible reconstructability.

The bottleneck has moved

from generation to reconstruction, provenance, proof and governance.

A-OSP's entry point

regulated work where evidence, absence of evidence and review already matter.

First wedge: multi-regime compliance. Strategic category: proof substrate for AI-assisted regulated work.

Founder-built asset: high leverage, not validation

1FTE + frontier AI produced a dense pre-company asset. The round converts it into an institution.

WHAT EXISTS TODAY

- ROA/A-OSP theory corpus
- Whitepaper + TechDD + CIPM
- Legal Operating Architecture
- Prototype / proof mechanics
- Investment pitch + strategic plan
- ~EUR 10k personal AI tooling spend

WHAT IT PROVES

- ✓ founder leverage
- ✓ category formation
- ✓ AI orchestration skill
- ✓ technical direction
- ✓ compressed IP capital

WHAT IT DOES NOT PROVE

- × market demand
- × production readiness
- × security certification
- × repeatable delivery
- × team independence

Investor interpretation: not idea-stage, but not company-stage either — a founder-built proof asset seeking institutional formation capital.

DEFINITION

What A-OSP is: a proof operating environment

A-OSP is not a chatbot, GRC dashboard or legal certification. It is a substrate around AI-assisted work.

A-OSP IS	A-OSP IS NOT
Browser-native epistemic operating environment	Native operating system
Text-first virtual epistemic filesystem	Arbitrary folder storage
Proof-and-knowledge substrate	Chatbot or document generator
Bounded model-call orchestration layer	Model-provider memory
Human-facing diagnostic workstation	Autonomous governance engine
Enterprise validation platform for proof-sensitive workflows	Legal advice or compliance certification

Technical spine: heavy stack, enterprise-candidate value

The stack is heavy because the target is not a toy MVP: local proof on mature web infrastructure.

Browser runtime

policy-manageable enterprise surface

Parser-service

EQL/MONL/proof APIs

LLM adapters

bounded replaceable processors

CI/CD guards

anti-drift control plane

React/Vite shell

workstation + app lenses

.aosp.txt stripes

durable local SSOT

Observatory/Error Truth

diagnostic failure objects

ENTERPRISE VALUE

- secure runtime
- source/cache split
- provider optionality
- diagnostic failures
- recoverable state
- guarded releases

Key message: mature web infrastructure is the substrate cost of local, auditable, scalable proof abstractions.

VFS and source-of-truth: sovereignty begins locally

The model is not memory. The database is not truth. The export is not proof.

Surface	Status	Rule
.aosp.txt / typed stripes	Durable source / SSOT	Canonical local proof substrate
Directus/PostgreSQL	Cache / index / admin	Rebuildable, non-canonical
React UI / app lenses	Projection and workspace	Must not own proof identity
LLM provider	Replaceable processor	Bounded call; no durable truth
PDF/DOCX/JSON export	Downstream representation	Non-proof unless witness-backed
Receipt/readback/witness	Proof surface	Explicit state, lineage, hashes

Local

session SSOT

Team

reviewed workflow SSOT

Enterprise

canonical approved SSOT

Promotion requires review, diff, conflict handling, receipt and rollback path.

SCOPE

D1/EQL is necessary — not sufficient

Local proof mechanics are the first seam. The big-bang requires full-stack enterprise operability.

LOCAL PROOF MECHANICS

- D1 intake & atomization
- EQL scoped retrieval
- FAE bounded model calls
- MONL transformation membrane
- Receipts + readback + negative tests

Founder can continue closing this seam with the current AI-assisted method.

ENTERPRISE-READINESS STACK

- security posture + identity
- recovery + observability
- provider exposure controls
- tenant isolation path
- runbooks + Authority Matrix
- delivery + governance controls

Capital buys this conversion: from locally proved to enterprise-operable.

Enterprise readiness is a work breakdown structure

The formation round pays for explicit workstreams, owners, budgets and definitions of done.

Workstream	Timing	Budget	Definition of Done
Secure SDLC	M0–M6	EUR 90k	threat model, review policy, secrets policy
Auth/RBAC/session	M3–M9	EUR 140k	role tests, session isolation, privilege review
Tenant isolation path	M9–M18	EUR 220k	no cross-tenant proof leakage
Observability	M6–M12	EUR 110k	metrics, traces, p50/p95/p99
Backup/recovery	M6–M12	EUR 85k	tested restore, RTO/RPO
Provider exposure registry	M6–M12	EUR 100k	payload, sensitivity, retention registry
ArtifactWitness / Proof Spine	M12–M24	EUR 300k	proof-bound export and downstream receipts

Big-bang rule: no enterprise pilot claim without P1 security, recovery, observability, provider exposure and runbooks.

Services-and-software before standard

A-OSP cannot become a Foundation-grade standard by technical proof alone. It must first operate.

Technical closure

P0/P1 proof and enterprise controls

Delivery capacity

assessment throughput and support coverage

Willingness to pay

paid pull, conversion, renewal

Management control

cash, claims, risk, governance

First 24 months test whether A-OSP becomes a repeatable services-and-software company — not a founder-bound consultancy.

Delivery capacity: assessment volume is a constraint

The plan must convert senior-days into templates, proof objects and channel method.

Scenario	Assessments	Hours / assessment	Total hours	Delivery FTE
A1 conservative	8	100	800	1.1
A1 plan	18	90	1,620	2.2
A2 plan	45	55	2,475	3.3
A3 plan	100	35	3,500	4.7

THROUGHPUT KPI

- delivery hours / assessment
- founder-dependency %
- advisor contribution %
- gross margin per assessment
- conversion to maintenance

High-focus model

4 days/week · 6h/day · serious benefits · explicit incident coverage. Accountability is measured by delivery and proof gates, not hours seated.

Market sequencing: sell, multiply, validate, institutionalize

Who pays more is not necessarily who enters first.

Segment	Role	Revenue role
PMI multi-regime	first paid pull	assessment
Advisor / associations / OdV	distribution + legitimacy	cohort/channel
Fintech / RegTech EMEA	support layer + standard adopter	pilot/adapter
Government / EU security	public trust + sovereignty	grant/procurement
Global AI / infrastructure	validation + strategic optionality	partnership

RegTech is support, not the enemy: A-OSP can be the proof substrate under or beside existing compliance workflows.

PRICING

Product ladder: paid proof first, standard later

Pricing is a planning envelope. First engagements validate price, delivery days, conversion and channel economics.

Offer	Price plan	Target	What is actually sold
PMI Assessment	EUR 22k avg	PMI	bounded multi-regime proof pack
SME Evidence Vault	EUR 6–9k/y	PMI	light maintenance, storage, re-run
SME Proof Maintenance	EUR 12–18k/y	PMI	quarterly review, gap register, lens updates
Association Cohort	EUR 50k	channel	repeatable workflow, templates, training
RegTech pilot	EUR 90k	support layer	proof adapter / bundle integration
Mid-market subscription	EUR 85k/y	regulated mid	proof workflow + lenses
Enterprise pilot	EUR 220k	enterprise	controlled proof workflow validation

A-OSP does not scale through manual volume: assessments generate templates, proof objects, channel method and recurring maintenance.

THE ASK

EUR 6.0M institutional formation round

The original EUR 1.2M is a lean proof round. It is not enough for enterprise-operable formation.

EUR 6.0M

base ask

range EUR 4.5–7.5M

EUR 1.5–2.0M

optional extension

TRANCHE LOGIC

T0 EUR 2M SRL + CTO + P0 sprint

T1 EUR 2M first clients + D1/EQL
progress

T2 EUR 2M P1 controls + channel
evidence

USE OF FUNDS (EUR M)

Financial plan: formation first, break-even later

P&L uses recognized revenue, not pipeline potential. A0–A2 are formation and evidence years.

Year	Recognized revenue	Gross margin	Opex	EBITDA
A0	EUR 80k	40%	EUR 900k	–EUR 868k
A1	EUR 550k	52%	EUR 2.25M	–EUR 1.96M
A2	EUR 1.85M	64%	EUR 3.05M	–EUR 1.87M
A3	EUR 5.8M	72%	EUR 4.7M	–EUR 520k
A4	EUR 13.5M	78%	EUR 7.4M	+EUR 3.13M
A5	EUR 30M	80%	EUR 14M	+EUR 10M

Break-even logic

A3 Opex EUR 4.7M at 72% GM needs about EUR 6.5M revenue to break even. A3 at EUR 5.8M is intentionally still below break-even.

Cash discipline

No grant, donation or sponsorship counts as runway until awarded, contracted and cash-timed.

Month 25–30 is conditional: funded by revenue, extension, grant, bridge or Round 2.

Governance operating system: decision rights before scale

The dual OpCo/Foundation strategy only works if power, claims and money are controlled.

Decision	Founder	CTO	Board	Legal	Standards
Proof architecture	C	R/A	I	C	I
Enterprise claim	C	R	A	C	I
Certification language	I	C	A	R	C
Senior hiring	R	C	A	I	I
Spec change	C	R	I	C	A

RACI: R = responsible · A = accountable · C = consulted · I = informed

Legal architecture follows proof architecture

If the evidence format is the trust object, it cannot be entirely captive.

Asset / function	Holder	Reason
Product IP / runtime / modules	OpCo	investor-backed commercial asset
Customer contracts / DPA / SLAs	OpCo	operational accountability
Open proof specification	Standards vehicle / Foundation	neutrality + interoperability
Certification mark	Foundation	trust + conformance signal
Reference implementation	Foundation/open core	commons + adoption path
Grants / donations / endowment	Foundation	public-interest funding separated from equity

Foundation-to-be: standard, public trust, informational sovereignty. OpCo: product, delivery, enterprise value capture.

ACTIVATION

Enterprise big-bang programmed: scale only after gates

Not triggered by D1/EQL alone. It requires proof, enterprise, market and institutional readiness.

Activation threshold: at least 7/10 gates before Foundation scale, enterprise pilots and strategic round.

DISCIPLINE

Risk and stop rules: fund discipline, not faith

A strong plan says when to stop, pivot or freeze.

Risk	Early signal	Stop / pivot
CTO not found	no credible candidate by M3	no full round deployment
P1 incomplete	security/observability/recovery missing	no enterprise pilot
Assessment demand weak	<6 paid assessments in A1	pivot target/pricing
Delivery too manual	>100h per assessment in A1	template before scale
Founder dependence high	>60% in A2	no big-bang
Foundation overhead premature	no members/grants/adopters	freeze standards vehicle
Burn exceeds plan	runway <9 months	hiring freeze + financing plan

Contained downside is not “it all works” — the asset stays technical, standardizable and diligenced even if scale gates fail.

Fund institutional formation, not a finished company.

A-OSP has a founder-built proof asset. The round buys SRL, CTO, enterprise hardening, delivery capacity, management control, commercial evidence, standards seed and a credible Foundation trajectory.

DATA ROOM SECTIONS

- technical posture + P0/P1/P2
- proof-flow demo + audit pack sample
- legal formation + IP/foundation docs
- commercial pipeline + SOWs + LOIs
- financial model + cashflow + sensitivity

ASK SUMMARY

EUR 6.0M institutional formation round

Optional EUR 1.5–2.0M extension

Tranche release against verifiable gates

D1/EQL proves the principle locally. The formation round makes the whole stack enterprise-operable and eventually standardizable.
